

EDAN65: Compilers, Lecture 13

Review of important concepts

Görel Hedin

Revised: 2020-10-11

Course overview

Regular expressions and scanning

NFA

DFA

Given some informal description, formulate a regular expression or automaton.

Translate between regular expressions, NFAs, DFAs.

Know how to combine automata representing tokens.

Know how to handle rule priority and longest match.

Context-free grammars

```
Exp -> Exp "+" Exp  
Exp -> Exp "*" Exp  
Exp -> INT
```

Given some informal description, formulate a language as a context-free grammar.

The elements of a context-free grammar $G=(N, T, P, S)$:
nonterminal symbols, terminal symbols, productions, start symbol

Understand what the language defined by a grammar is.

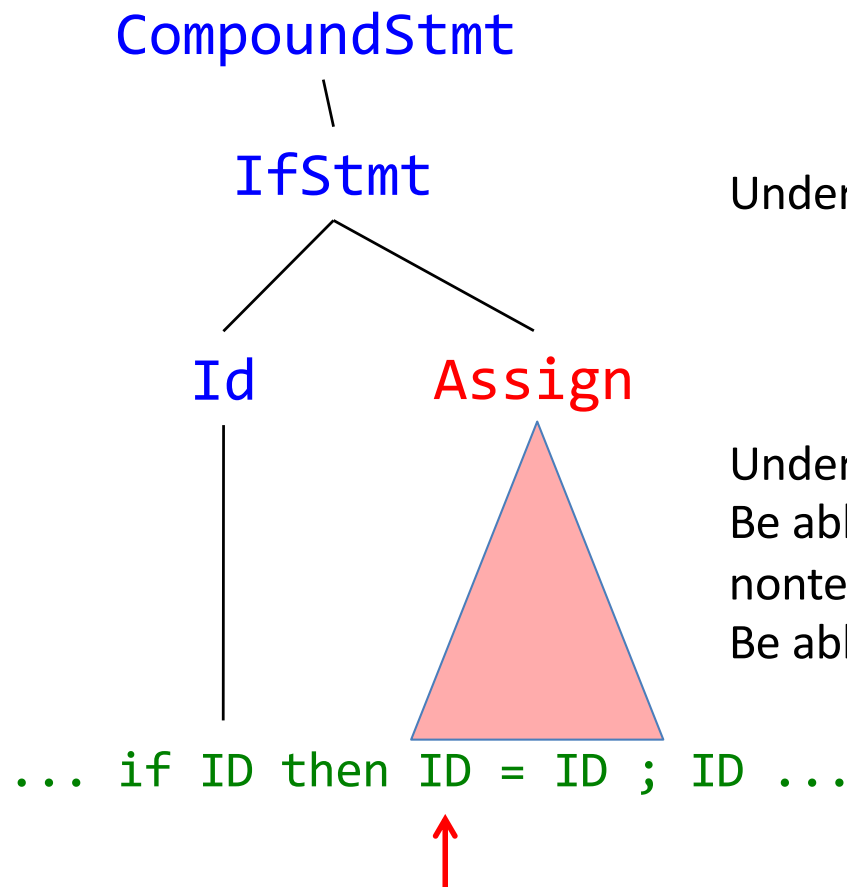

Understand the difference between regular expressions and context-free grammars.

```
Exp  
=> Exp "+" Exp  
=> INT "+" Exp  
...
```

Derivations. How to prove that a sentence belongs to a language.

Parse trees. How a parse tree corresponds to a derivation.

LL Parsing

Understand the main idea of how LL parsing works

Understand the concepts of FIRST, Nullable, and FOLLOW.
Be able to compute them for a given nonterminal in a grammar.
Be able to construct an LL(1) table.

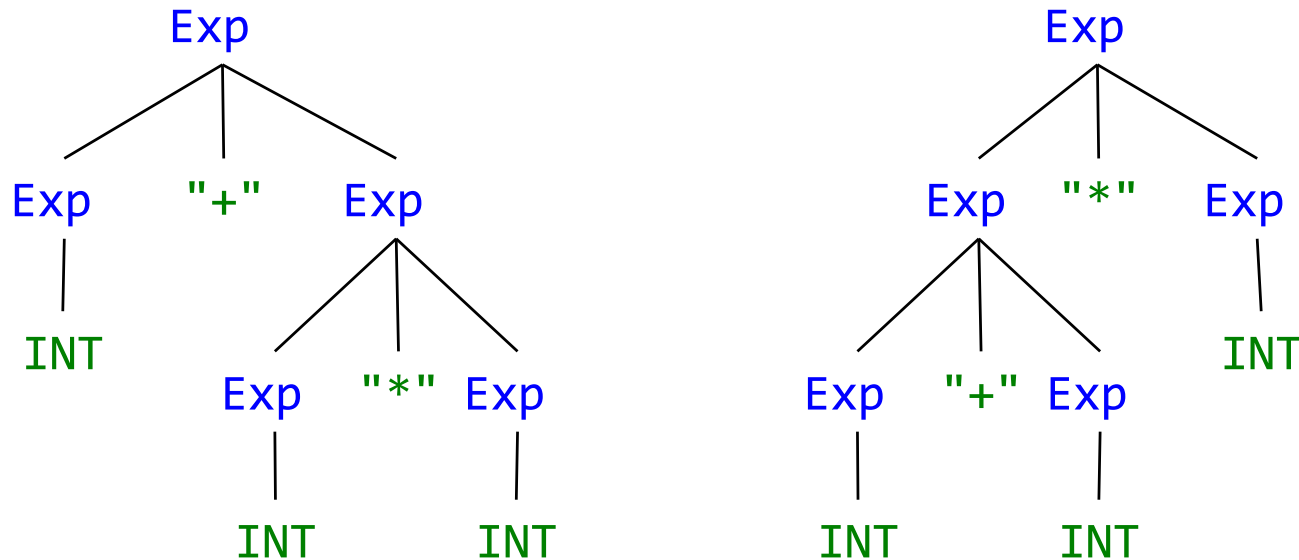

Be able to construct a recursive-descent parser for a given LL(1) grammar.

Understand what left recursion and common prefix mean.

Understand why grammars with these properties are not LL(1).

Be able to transform such a grammar to an equivalent LL(1) grammar.

Ambiguities in context-free grammars

Understand what it means for a grammar to be ambiguous.

Understand what it means for two grammars to be equivalent.

Be able to prove that a grammar is ambiguous for common ambiguities (expressions and dangling else).

Be able to transform an ambiguous grammar to an equivalent unambiguous grammar, for common ambiguities.

Notations for context-free grammars

$A \rightarrow B d e C f$
 $A \rightarrow g A$

Canonical form

$C \rightarrow D a b \mid b E F \mid a C$

BNF

$G \rightarrow H^* i \mid (d E)^+ F \mid [d C]$

EBNF

Be able to formulate grammars on canonical form, as BNF, and EBNF
Be able to translate between these forms.

Abstract grammars

Abstract grammar

```
abstract Stmt;  
IfStmt : Stmt ::= Expr Stmt;  
Assignment : Stmt ::= IdUse Expr;  
IdUse : Expr ::= <ID:String>;
```

Understand the difference between an abstract grammar and a context-free grammar.

Understand how an abstract grammar corresponds to an object-oriented model.

Be able to design an abstract grammar for a simple language, corresponding to a good object-oriented model.

Be able to design a high-level (possibly ambiguous) concrete grammar that is very close to an abstract grammar.

LR parsing

Understand the main idea of how LR parsing works with shift, reduce, and accept actions.

Be able to show which actions an LR parser takes when parsing a specific example.

Understand why LR is more powerful than LL.

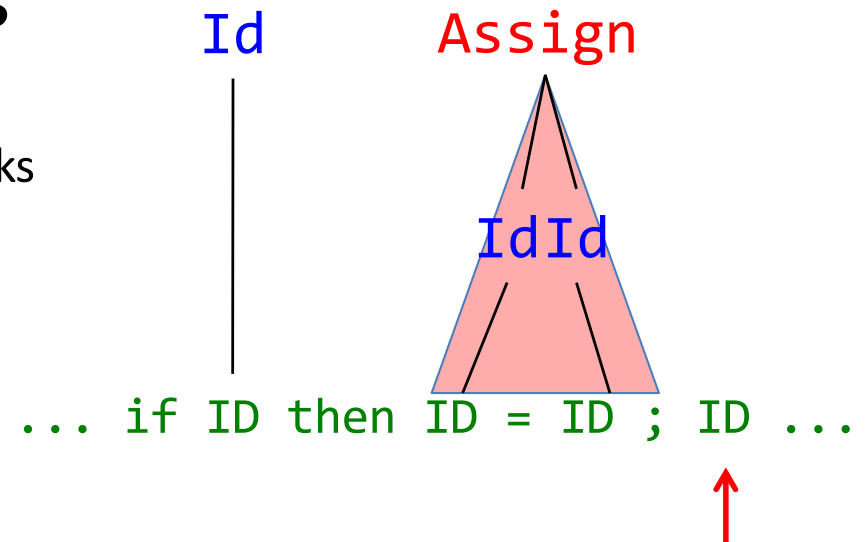

Understand what an LR item is.

Understand what an LR state is.

Understand what an LR conflict is.

For a given LR conflict, be able to construct a program that would expose the conflict (for a simple case).

I will **not** ask you to construct an LR DFA or an LR parsing table on the exam.

E	->	E	•	"+"	E	?
E	->	E	"*"	E	•	"+"

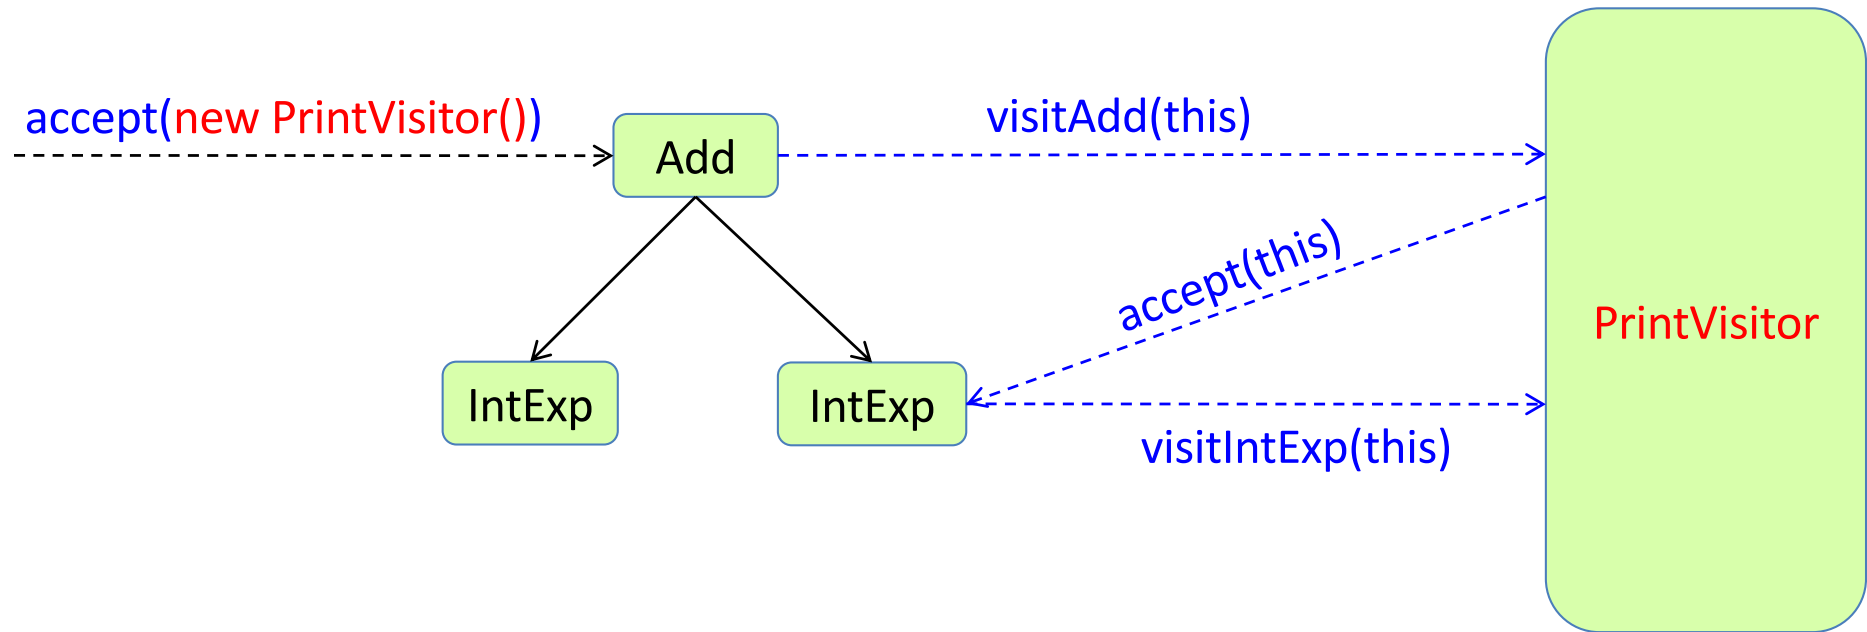

Static aspects with intertype declarations

```
aspect Evaluator {  
    abstract int Expr.value();  
    int Add.value() { return getLeft().value() + getRight().value(); }  
    int Sub.value() { return getLeft().value() - getRight().value(); }  
    int IntExpr.value() { return String.parseInt(getINT()); }  
}
```

Understand how static aspect-oriented programming with inter-type declarations works.

Be able to program problems using methods declared in aspects.

Visitors

Understand how the visitor pattern works.

Be able to program problems using visitors.

Reference attribute grammars

```
inh int B.i();  
eq  A.getB().i() = 2;
```

Understand how reference attribute grammars work, with different kinds of attributes: synthesized, inherited, parameterized, NTAs, circular, and collection attributes.

Given an attribute grammar and an example AST, be able to compute attribute values.

Be able to program problems using reference attribute grammars.

You **don't** have to memorize details in the JastAdd syntax –
copies of the JastAdd reference manual will be available at the exam.

Runtime systems and code generation

Understand how an activation stack works, with frame pointer, stack pointer, and dynamic link.

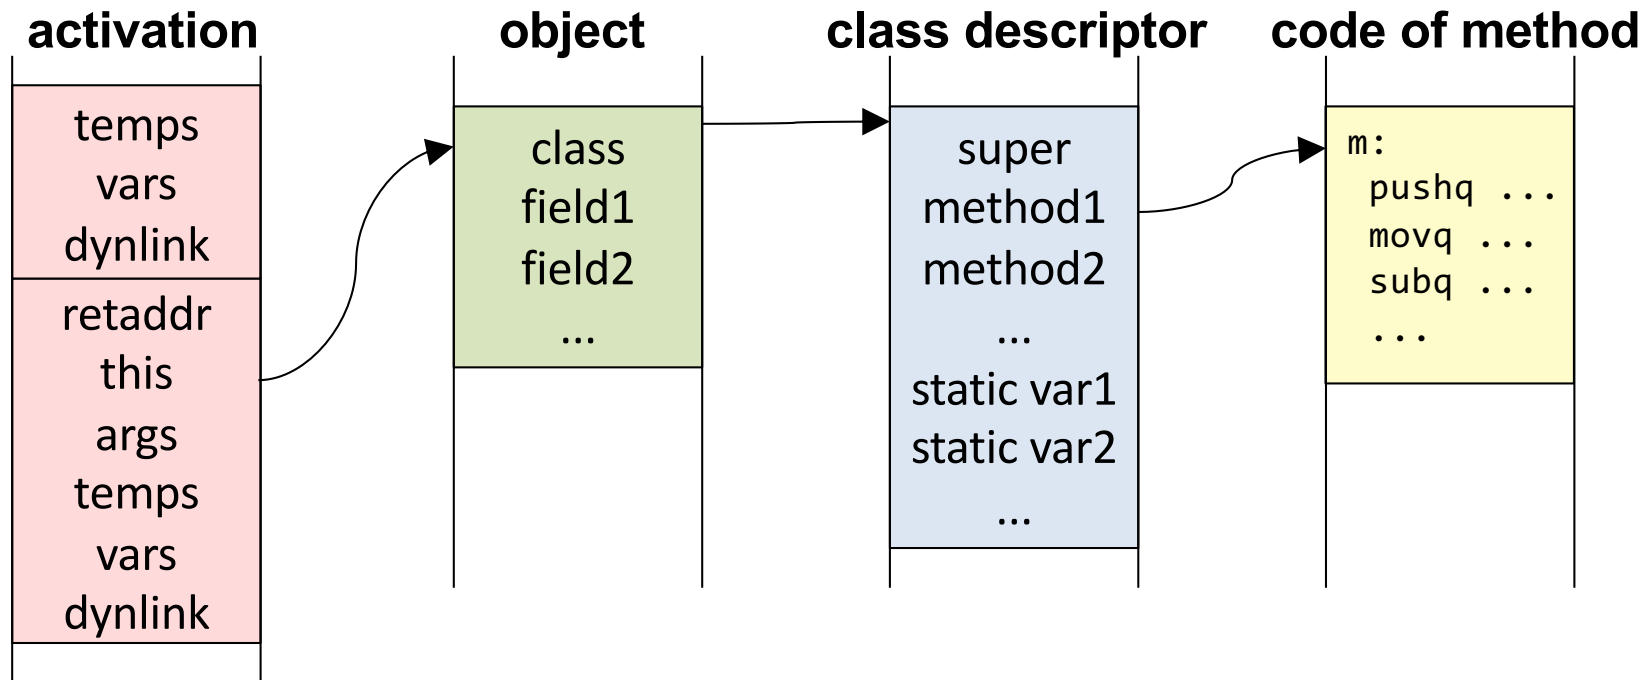

Understand simple calling conventions, like passing arguments on the stack and the return value in a register.

Be able to write down x86 assembly code for procedure calls, procedure activation and returns, and simple computations like loops, assignments, expression evaluation, etc.

Be able to draw the contents of the stack for a given execution point in a program.

You **don't** have to memorize x86 instructions – the cheat sheet will be available at the exam.

Runtime systems for object-oriented languages

Understand the role of the static link ("this" pointer).

Understand how prefixing works for single inheritance of fields.

Understand how vtables work for single inheritance dynamic dispatch.

Have an overall understanding of how dynamic adaptive compilation works with inline call caches and PICs.

Have an overall understanding of how different garbage collection algorithms work, with mark-sweep, copying, generational, and reference-counting.

You **don't** have to memorize how to handle multiple inheritance.

Preparing for the exam

Read slides, book, papers, lab descriptions.

Do the quizzes and the exercises.

E13 contains exercises for many parts of the course.

Study old exams.

See <http://cs.lth.se/edan65>

Ask at the **forum** if you have questions!

Don't forget to **sign up** for the exam by Monday 2020-Oct-19.

Students who have not signed up will not be admitted to the exam.

You need to **finish the assignments/labs** before the exam.

Catch-up lab sessions:

- Tuesday Oct 13, 15:00-17:00
- Tuesday Oct 20, 13:00-15:00

The exam

On-campus: MA:8 and MA:9, Wednesday Oct 28, 9:00-12:00

Safety measures because of Corona pandemic:

- More space, shorter exam time, exam adapted accordingly.
- Digital backup plan for
 - students in risk groups
 - students with cold symptoms on the morning of Oct 28

Digital backup plan

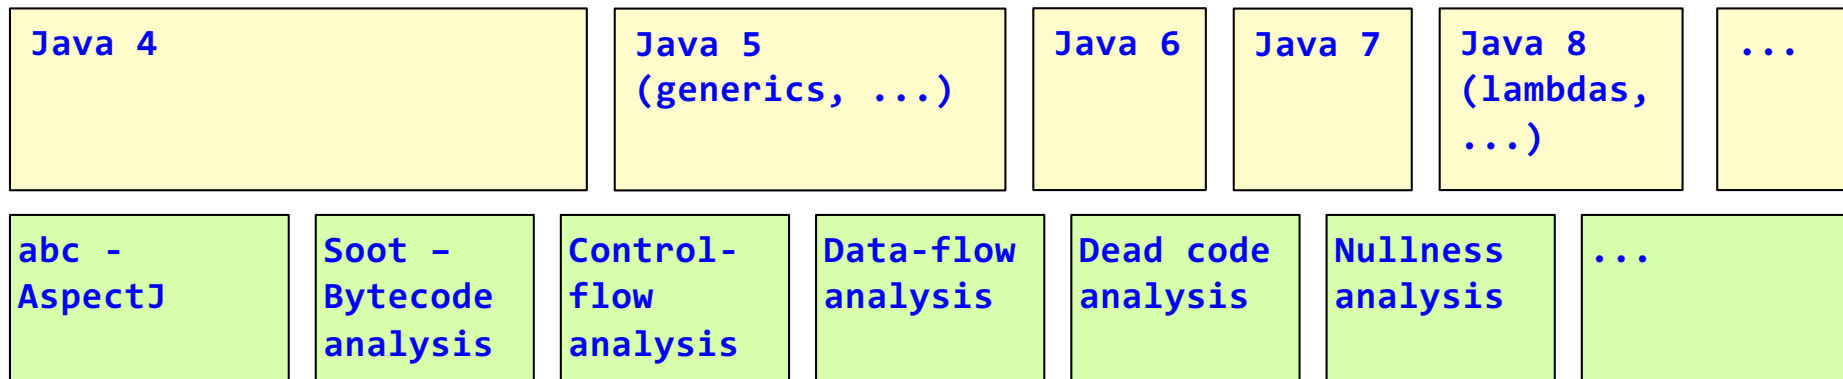

- Zoom monitoring (web cam and screen share in breakout room), Moodle, for solutions on paper: scan and upload results
- Complementary oral exam, explain results, answer additional questions

There will be detailed instructions well before the exam.

Guest lecture on ExtendJ

tomorrow, Tuesday, Oct 13, 11:15-12:00

Dr. Jesper Öqvist will present ExtendJ, an extensible Java compiler built using JastAdd.

Jesper works part time at LTH and part time at the startup Cognibotics where he is contributing to the design of a new robotics language.

The lecture will be in the usual zoom channel.

Continued studies and work

- EDAN70/90: Project in Computer Science, lp2
- EDAP15: Program analysis, lp2
- EDAP05: Programming language concepts, lp2, fall 2021
- EDAN75: Optimizing Compilers, lp1, fall 2022
- Compiler related master thesis projects in industry (ARKAD Nov 11-12)
 - Modelon AB, Lund
 - ABB, Malmö
 - Arm, Lund
 - Axis, Lund
 - ...
- Master thesis projects at the CS department
- Student internships/stipends at Tech companies, e.g., Google summer of code, Google internships
- ...
