

# Yoodo 3.0

## Background

Yoodo Group AB is a company located in Lund that provides customers in need of IT and design competence with talents. Through the website Yoodo.se companies can post job opportunities which in turn the IT and design talents can apply for. The launch of Yoodo.se 2.0 is scheduled November 12th and the planning for Yoodo 3.0 coming up. The website is coded in PHP with a MySQL database. An extended version is soon going to be developed.

## Goal

The goal with version 3.0 is to make it even more easy for companies to find the most suitable talents for their projects.

## Functionality

- The functionality in the previous version that does not conflict with the new functionalities should still be handled by the system.
- The different talents should be able to endorse each others talents.
- A filter function with an algorithm to decide which talents coming first in the list when filtering on a specific skill.
- Three different ads with different features should be able to be bought.
- A function to import LinkedIn profiles to their Yoodo profile. (Open API)
- The talents should be able to take tests to prove their skills and show on their profile. (No worries about the tests as such)
- A weekly mail with all interesting ads sent to each talent.

Data to take into consideration in the filter function could be matching skills, days on Yoodo, endorsements etc.

## Roles

We want you to develop the requirements specification for Yoodo 3.0 that we further on can develop.
