

# Predicting survivability of waiting heart transplant patients

# Intro to UNOS Data Set

# Preparing the Data Set

- Choosing relevant features (available at  $t=0$ )
- Unwanted data - 18+, duplicate entries, uninteresting patient outcomes
- Outlier removal
- Imputation of missing data

# Preparing the Data Set

- Normalization
- Encoding - One-hot
- Undersampling
- Other feature engineering efforts

# Metric - F1 Macro Score

$$\text{precision} = \frac{\text{true positives}}{\text{positives}}$$

$$\text{recall} = \frac{\text{true positives}}{\text{true positives} + \text{false negatives}}$$

$$\text{f1\_score} = \frac{2}{\frac{1}{\text{precision}} + \frac{1}{\text{recall}}}$$

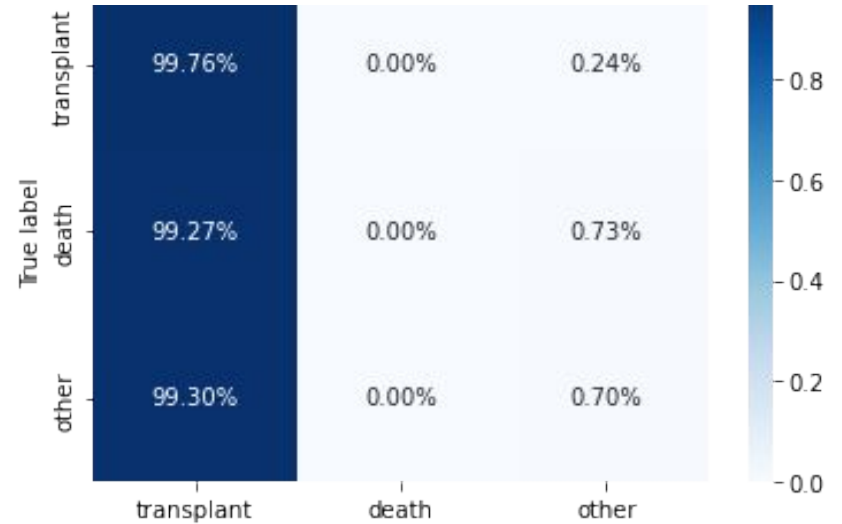

$$\text{f1\_macro} = \text{avg}(\text{f1\_score})$$

# First (very poor) model

	precision	recall	f1-score	support
Transplanted	0.66	1.00	0.79	37905
Died	0.00	0.00	0.00	7690
Other	0.36	0.01	0.02	12181

**F1 macro: 0,27**

# Logistic Regression

# Waitlist Model

## Single Layer Neural Network

	precision	recall	f1-score	support
Transplanted	0.89	0.97	0.92	13219
Died	0.79	0.58	0.67	607
Still Waiting	0.74	0.54	0.62	3667

**F1 macro: 0,74**

# Death Interval Model Logistic Regression

	precision	recall	f1-score	support
Transplanted	0.78	0.69	0.73	1177
Died < 50d	0.55	0.62	0.58	1124
Died < 10m	0.38	0.31	0.34	1053
Died > 10m	0.57	0.66	0.61	1168

**F1 macro: 0,57**

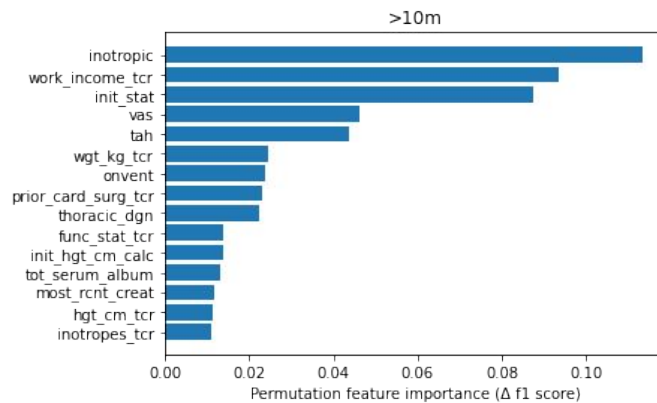

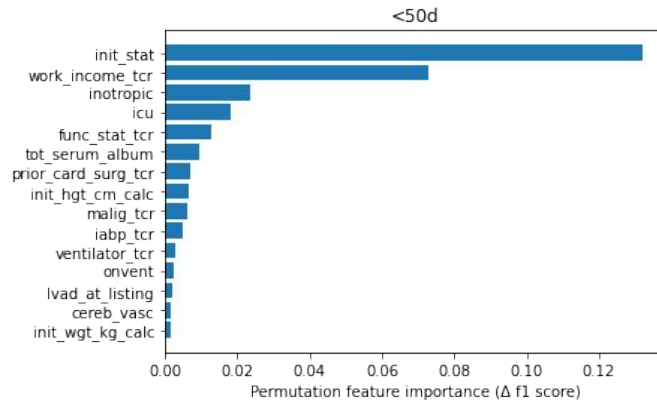

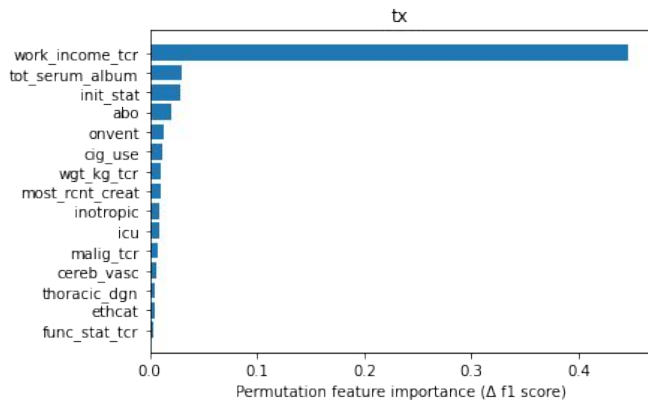

# Permutation Feature Importance
