Further Pre-Training on Heart Transplant Research

HUGO TORBIÖRNSSON & GUSTAV ROSENGREN

Training a Large Language Model

Further Pre-training

Strengthen general language understanding within a domain

Often unmarked

Predict next token

Fine-tuning

Specialize the model for a specific purpose

Labeled data / instructions

Q&A, Classify, Translate ...

Dataset

- 25 PDFs -- all scientific heart transplant articles

- Parsing and cleanup of irrelevant information → ~25k rows for tokenization
 - Small amount of data in this context

IABPs are traditionally inserted via the femoral artery, which limits the patient in terms of Pt, as ambulation is often institutionally prohibited with the device in the femoral artery position. Not only is insertion site bleeding a possibility, but the Iabp may become kinked with hip exion leading to

Tools

- Lightweight and Optimized Framework

LUNARC

Lund University

- GPU Cluster

- Setup initial pipeline

Method

- Llama-3.1-8B

- LoRA, Low Rank-Adaptation
- Quantization, reduces precision of weights

Example

```
prompt = "Heart transplant recipients are prone to"
```

```
Heart transplant recipients are prone to rejection of the new organ.  
The body's immune system recognizes the transplanted organ as foreign and attacks it.  
The rejection is typically mild and can be treated with immunosuppressant drugs  
But if the attack is severe, it can be fatal.
```

Perplexity

$$PP(W) = \frac{1}{P(w_1, w_2, \dots, w_N)^{\frac{1}{N}}}$$

Confident about next token -> low perplexity

Uncertain about next token -> high perplexity

FACULTY OF
ENGINEERING

Perplexity

"Rejection of the
transplant is treated with"

Input to model

Target (Next Token)

Higher Perplexity

"Ibuprofen"

"immunosuppressants"

"medicine"

"garlic"

Conclusions

- Highly possible to make a difference - model has improved
- More data -> better results
- If possible - keep quantization to a minimum
