GAME IDEAS

- **Asteroids**
 - Control ship
 - Spawn asteroids randomly
 - Avoid/shoot them down
 - Keep track of health if ship crashes
- **Torus Ride**
 - Place tori along path
 - Control ship
 - Fly-through rings to collect points
 - Time the run
- **Your own idea**
 - Set your creativity free!
 - Discuss with TAs

When you are done

▲ Exercise 5-1

- Fixed array of asteroids

```
Node asteroids[N];           // Raw array
std::array<Node, N> asteroids; // STL array
```

- Respawn when out of view or shot down
- Hide/unhide:

```
if(visible) {
    asteroids[i].render(...);
}
```

- Randomize position, velocity vector, etc.
- Alter appearances using size, shaders, tessellation, noise, ...

▲ Exercise 5-1

- Minimum requirements (Asteroids, Torus Ride)
 - Ship/camera manoeuvrability
 - Use of tessellated objects with shaders
 - Translational and rotational animation
 - Fixed object array (respawn if needed)
 - Game presentation at lab session and on forum gallery
- Optional
 - Game states
 - Collision detection
 - Physics simulation
 - Score count
- Own idea
 - Discuss with TAs

Game ideas

- General considerations
- Asteroids
- Torus Ride

Collision detection and physics

- Sphere-sphere
- Ray-sphere
- Code sketch
- Physics

General guidance

- Game state
- Creating new files
- Importing new models
- Drawing lines
- Cube map
- User input
- Output
- Randomization
- Distribute your game

Assignment 5

▲ Exercise 5-1

EDAF80: Game Gallery

WHEN YOU ARE DONE

- Make a short post on the forum, #end-game-gallery, presenting your game
 - Title
 - Creators
 - Game objectives
 - Features and how you implemented them
 - Screenshots (or a short video)

▲ Exercise 5-1

Seminar Exercise 5-1: Fragment Shader Art

- 1 ***uv*** holds the screen-space coordinates adjusted for the aspect ratio. Visualize this by setting the ***color*** to the euclidian distance to the origin. Use `length()`. You can save the distance in the `float` called `d`.
- 2 Having just one color can be a bit boring, so let's use a palette. Send the calculated distance to the `palette()` function and use the return value as color.
- 3 Now let's transform `d` to be something more than just the euclidian distance. Make sure to do the transformations after calculating the palette color.
 - Create concentric sine waves with: `d = sin(d * 8.0 - time) / 8.0;`
 - They are a little dark so boost the values: `d = 0.02 / d;`
 - Negative values don't help us very much so we can use them to double the frequency: `d = abs(d);`
- 4 Let's add some latitudinal and longitudinal dependencies as well. Introduce two new variables:
 - `float s = sin(uv.x * 4.0 - time);`
 - `float t = sin(uv.y * 36.0);`
 - Add them to the color calculation: `color *= d + s + t;`
- 5 Play around with the values and introduce new effects!
