Pile of Guidelines, Trainings, Focus
- ▶ Solution
Automation and Short Feedback-loop

Summary: When shifting to agile, continuous software engineering we automate more. However many non-functional requirements, like architecture requirements are still given to the developers as a pile of documents. These can also be automated with a short feedback-loop.

Background

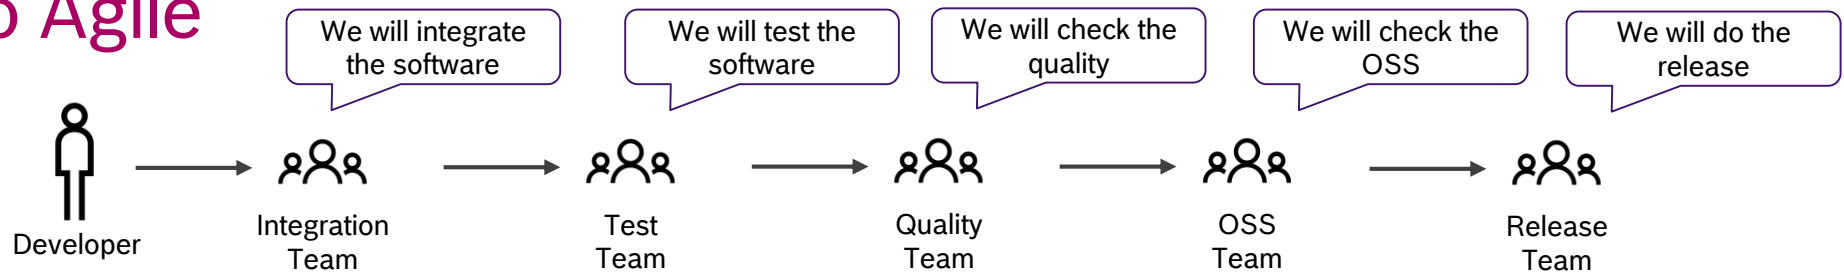

Test of functional and non-functional requirements

Non-functional tests like performance, security, open source legal compliance, etc. must be performed for every added or changed feature.

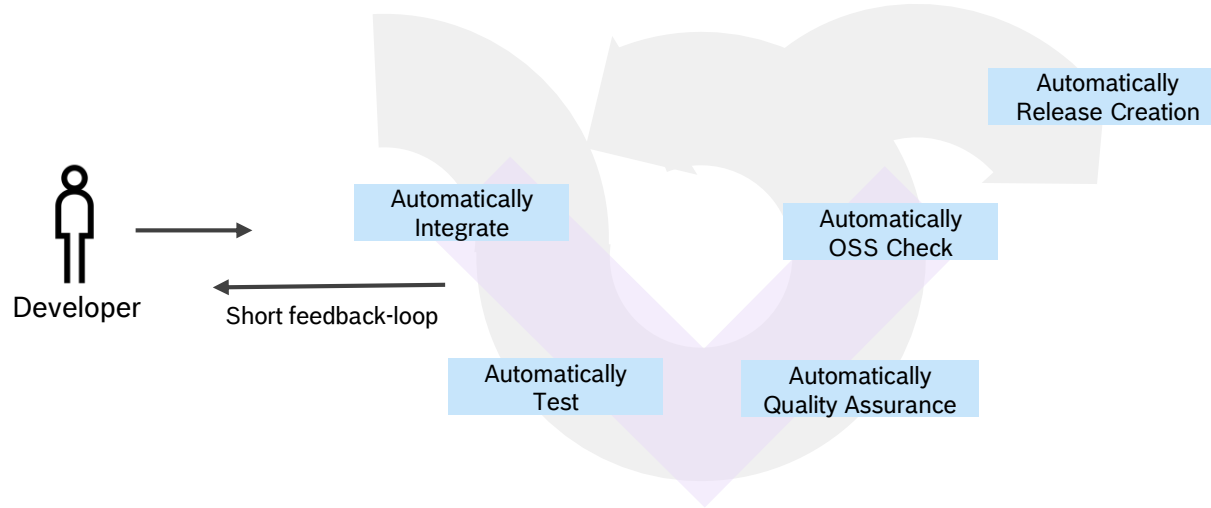

Background

Waterfall to Agile

Traditional

Agile

Modern agile software development is running in iterations with automation and short feedback-loops. The developer makes sure the code is integrated, tested and quality assured.

Background

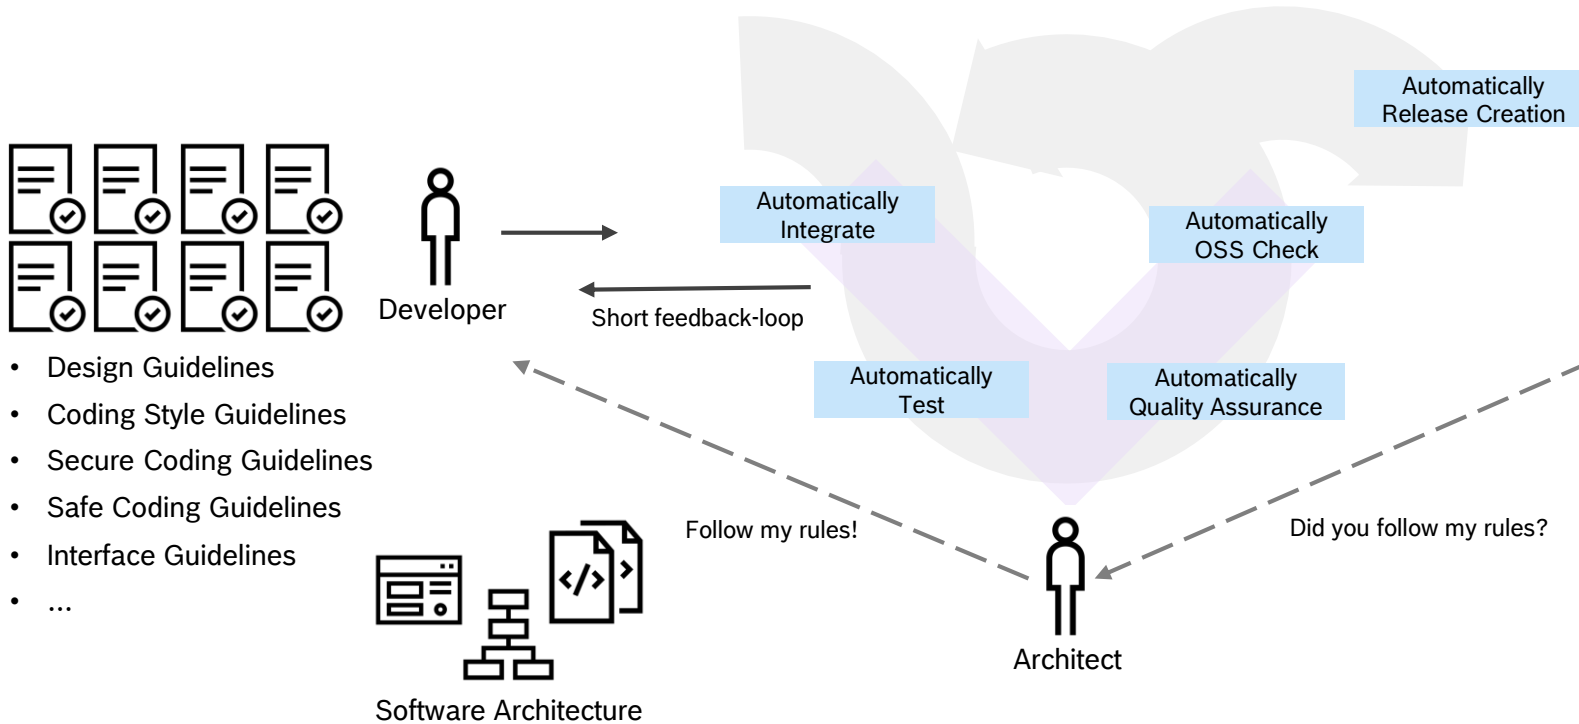

Examples of Automation

- ▶ Integration
 - ▶ Automatic continuous integration in Git/Gerrit/Jenkins
- ▶ Test
 - ▶ Automatic verification of unit-test results and code coverage
 - ▶ Automatic validation of requirements through system-tests
- ▶ Quality Assurance
 - ▶ Automatic verification of boot performance
 - ▶ Automatic verification of memory budget
- ▶ OSS
 - ▶ Automatic scan of code in Black Duck®

Several integration, test and quality assurance activities are automated. This makes it possible to have fast short feedback-loops to the developer.

Problem Statement

But what about Architecture Rules and Guidelines?

The architecture rules, models and guidelines are usually not checked automatically. Instead a large pile of guideline documents and architecture diagrams are given to the developers.

Problem Statement

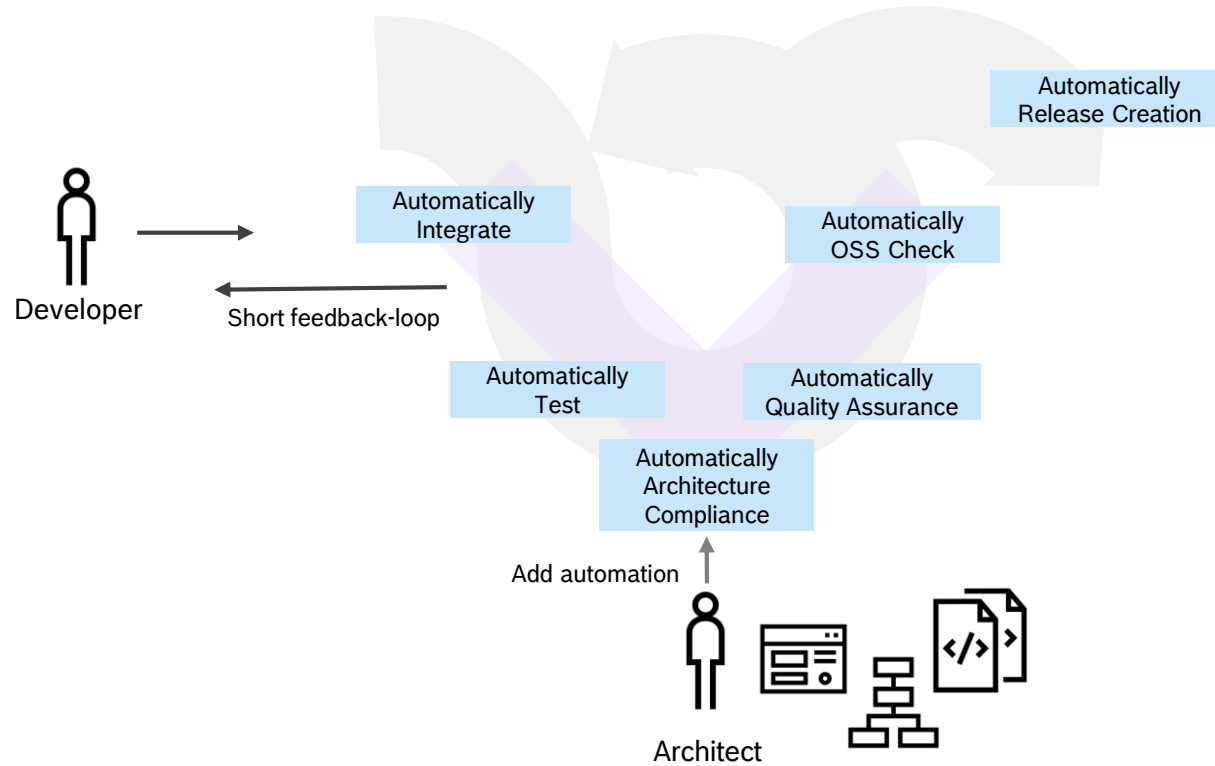

Pile of guidelines and architecture documents

- ▶ It is hard for a developer to keep all details in their head all the time
- ▶ When one area is facing issues (like security) other areas tend to be missed
- ▶ The architect writing the guidelines spend much time presenting and train the developers
- ▶ Model/Code GAP becomes large
- ▶ It might be a long time until feedback is given

This causes several problems and extra effort both for the developers and the architects.

Solution

Automate the Validation of Guidelines and Models

Use the toolchain to create a feedback loop for the developers. The feedback loop will increase developer knowledge, prevent mistakes and automatically govern the changes.

More detailed information

“Using automated tests for communicating and verifying non-functional requirements”
 2014 IEEE 1st International Workshop on Requirements Engineering and Testing (RET) - R. Lagerstedt
<https://ieeexplore.ieee.org/document/6908675>

“Implementing and Evaluating the Use of Automatic Tests for Architectural Rules”
 Master Thesis LTH/Bosch – J. Bäckström, F. Karåker Sundström

The diagram in Figure 3.1 shows the work flow: Developer commits code to Gerrit. Team Members review code in Gerrit. Gerrit triggers Jenkins Build Tests. Jenkins sends feedback to Gerrit. The text in 3.2 states that guidelines were summarized to make it easier for developers to follow the intended architecture.

Software Center – Continuous Architecture Theme

The screenshot shows the 'Managing Modelling Inconsistencies' article on the Software Center website. It discusses the challenges of managing inconsistencies in system models and provides strategies for handling them, such as using modeling languages and tools to manage complexity and ensure consistency across different views of the system.
